Appl. No. 09/964,999

Response to Notice of Non-Compliant Appeal Brief dated 05/09/2006

Reply to Office Action of 05/04/2006

BRIEF FOR APPLICANTS - APPELLANTS

(i)

Real Party in Interest

The real party in interest is International Business Machines Corporation (IBM), the assignee.

(ii)

Related Appeals and Interferences

There are no other appeals or interferences known to appellants, appellants' representative or assignee, which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

(iii)

Status of Claims

Claims 1 - 20 have been finally rejected under 35 U.S.C. §102(a) as being anticipated by Meyer (US 6,701,364) in an Office Action dated July 25, 2005. In that Office Action, Claims 3, 8, 13 and 18 were also rejected under 35 U.S.C. §112 as failing to comply with the enablement requirement. In a telephone interview on September 19, 2005, the Examiner agreed to cancel Claims 3, 4, 8, 9, 13, 14, 18 and 19 by Examiner's amendment in order to put the Application in proper form for Appeal. However, in an interview Summary dated October 19, 2005, the Examiner stated that the claims will have to be canceled by Applicants in the Appeal Brief.

Consequently, Claims 3, 4, 8, 9, 13, 14, 18 and 19 are canceled in the present Appeal Brief. Further, Claims 5, 10, 15 and 20 are amended to change their dependency from a canceled claim to a pending claim.

Thus, Claims 1, 2, 5 - 7, 10 - 12, 15 - 17 and 20 are being appealed.

Reply to Office Action of 05/04/2006

(iv)

Status of Amendment

All amendments, except the one in the present Appeal Brief, have been entered.

(v)

Summary of the Claimed Subject Matter

The present invention provides an apparatus, system, computer program product and method of ascertaining remote systems accessibility before running remote commands (see Title on page 1). Accordingly, when a command, to be executed on remote computer systems, is entered in a local command interface, a check is automatically made to determine each of the computer systems accessibility. The command is then sent only to the computer systems that have been determined to be accessible (see page 14, lines 24 – 30 and item 730 in Fig. 7).

(vi)

Grounds of Rejection to be Reviewed on Appeal

**(1) Whether Claims 1, 6, 11 and 16 were properly rejected under 102(e) as being anticipated by Meyer, and (2) whether Claims 2, 7, 12 and 17 were properly rejected under 103 as being unpatentable over Meyer in view of Johnson II et al.**

(vii)

Arguments

**Whether Claims 1, 6, 11 and 16 were properly rejected under 102(e) as being anticipated by Meyer**

In considering a Section 102 rejection, all the elements of the claimed invention must be disclosed in a single item of prior art in the form literally defined in the claim. *Jamesbury Corp. v. Litton Indus. Products*, 756 F.2d 1556, AUS920010901US1

Appl. No. 09/964,999

Response to Notice of Non-Compliant Appeal Brief dated 05/09/2006

Reply to Office Action of 05/04/2006

225 USPQ 253 (Fed. Cir. 1985); *Atlas Powder Co. v. Dupont*, 750 F.2d 1569, 224 USPQ 409 (Fed. Cir. 1984); *American Hospital Supply v. Travenol Labs.*, 745 F.2d 1, 223 USPQ 577 (Fed. Cir. 1984).

Meyer purports to display a method and apparatus for remote computer management using web browser application to display system hardware and software configuration. According to the purported teachings of Meyer, a controlling computer addresses a remote standalone computer system through an HTTP server. Once communication is established between the controlling computer and the remote standalone computer system, computer diagnostics are performed.

However, Meyer does not teach the steps of *entering a remote command in a local command interface, automatically determining each of the computer systems accessibility and dispatching the command to the computer systems that are determined to be accessible* as claimed. That is, since Meyer advocates the use of a browser to establish communication between the controlling computer and the remote computer, then a user, at the controlling computer, has to manually (**and not automatically**) attempt to connect with the remote computer (e.g., using the remote computer's IP address). It is only after the communication has been established that the user may have the opportunity to enter the command to be executed by the remote computer in the browser (see col. 6, lines 1 – 23 and col. 7, lines 26 - 39).

Note that the scenario described above has to occur for every remote standalone that the user wants to communicate with. Therefore, the command has to be entered as many times as there are standalone computers that are being diagnosed.

**Whether Claims 2, 7, 12 and 17 were properly rejected under 103 as being unpatentable over Meyer in view of Johnson II et al.**

Meyer, as stated by the Examiner and as described above, teaches the step of determining whether a remote computer system is accessible without the  
AUS920010901US1

Appl. No. 09/964,999

Response to Notice of Non-Compliant Appeal Brief dated 05/09/2006

Reply to Office Action of 05/04/2006

step of pinging the computer system by having a user manually send an HTTP request from the controlling computer to the standalone computer. Yet, the Examiner uses Johnson II et al., which teaches the step of pingging a computer to perform incremental network transmissions to the computer, as support for the rejection of the dependent claims. Applicants respectfully disagree.

It is a well settled law that "[w]hen [an] ... invention is made by combining known components to achieve a new system, the prior art must provide a suggestion or motivation to make such a combination. It is insufficient that the prior art shows similar components, unless it also contains some teaching, suggestion, or incentive for arriving at the claimed [invention]. See *Northern Telecom, Inc. v. Datapoint Corp.*, 908 F.2d 931, 934, 15 USPQ 2d 1321, 1323 (Fed. Cir. 1990), *Heidelberger Druckmaschinen AG v. Hantscho Commercial Prods., Inc.*, 21 F.3d 1068, 1072, 30 USPQ 2d 1377, 1379 (Fed. Cir. 1993).

Since Meyer specifically teaches a method of determining a computer's accessibility, why, then, would someone incorporate the step of pingging described by Johnson II et al. to determine whether a remote computer system is accessible absent some specific teachings in the references to do so?

Further, even if, arguendo, someone were to be motivated to combine the teachings of Meyer with those of Johnson II et al., Applicants fail to see how the resulting combination would show the claimed invention. That is, the pingging would have to replace the HTTP request. And if the HTTP request is replaced how would the resulting combination perform the task in the claimed invention?

Thus, Applicants submit that Claims 2, 7, 12 and 17 are allowable over the applied references.

Hence Applicants request allowance and passage to issue of all the pending claims.

# APPENDIX

1. (Previously amended) A method of executing remote commands on remote computer systems comprising the steps of:

entering a remote command in a local command interface, said command to be executed by said computer systems;

automatically determining each of said computer systems accessibility;  
and

dispatching said command to the computer systems that are determined to be accessible.

2. (Previously amended) The method of Claim 1 wherein said step of automatically determining the computer systems accessibility includes the step of pinging each of said computer systems.

3. Canceled.

4. Canceled.

5. (Currently amended) The method of Claim [[4]] 2 further including the step of automatically re-dispatching the command for execution to a computer system that failed to execute the command successfully and was corrected.

6. (Previously amended) A computer program product in a computer readable medium for executing remote commands on remote computer systems comprising:

code means for allowing a remote command to be entered in a local command interface, said command to be executed by said computer systems;

code means for automatically determining each of said computer systems accessibility; and

code means for dispatching said command to the computer systems that are determined to be accessible.

7. (Previously amended) The computer program product of Claim 6 wherein said code means for automatically determining the computer systems accessibility includes code means for pinging each of said computer systems.

8. Canceled.

9. Canceled.

10. (Currently amended) The computer program product of Claim [[9]] Z further including code means for automatically re-dispatching the command for execution to a computer system that failed to execute the command successfully and was corrected.

11. (Previously amended) An apparatus for executing remote commands on remote computer systems comprising:

means for entering a remote command in a local command interface, said command to be executed by said computer systems;

means for automatically determining each of said computer systems accessibility; and

means for dispatching said command to the computer systems that are determined to be accessible.

12. (Previously amended) The apparatus of Claim 11 wherein said means for automatically determining the computer systems accessibility includes means for pinging each of said computer systems.

13. Canceled.

14. Canceled.

15. (Currently amended) The apparatus of Claim ~~14~~ 12 further including means for automatically re-dispatching the command for execution to a computer system that failed to execute the command successfully and was corrected.

16. (Previously amended) A computer system for executing remote commands on remote network computer systems comprising:

at least a memory device for storing data;

at least a processor for allowing a command to be entered in a local command interface, said command to be executed by said network
